Tesla issues sixth Cybertruck recall in a year

Tesla's Cybertruck is facing its sixth recall since its launch a year ago.

The recall affects [2,431 units](#), including certain 2024 Cybertrucks built between November 6, 2023 and July 30, 2024. A report from Tesla found that those trucks are or were equipped with a faulty drive inverter.

“If the inverter stops producing torque, the driver loses the ability to apply torque to the vehicle using the accelerator pedal resulting in a loss of propulsion, which may increase the risk of a collision,” reads Tesla's report.

In October, [Tesla recalled 27,185 Cybertrucks](#) due to a delay in the rearview camera image that could impair driver visibility. Unlike that recall, which required an over-the-air update, Tesla will need to physically replace the recalled drive inverter, which the EV-maker said it would do free of charge.

Other Cybertruck recalls this year include one in April due to a [sticky accelerator pedal](#), and another in June to fix potentially loose trim pieces and defective windshield wipers.
