# Project Overview

## Electrocatalyst Supports and Electrode Structures

### Timeline

- “Started” FY04
- End date not established
- 25% Complete

### Barriers

- B. Cost
- C. Electrode Performance
- A. Durability?

### Budget

- 100% DOE
- Total FY04 = ~ \$400k
- Total FY05 = \$800k

### Partners

- Radoslav Adzic and co-workers (BNL)
- LANL T-10 and T-12 (Theoretical Physics)
- Karren More (ORNL)

# Project Objectives

**Overall Objective:** Contribute to DOE effort in developing an efficient, durable, direct hydrogen fuel cell power system for transportation.

## Specific goals:

- Substantially reduce the amount of Pt required.
- Improve Pt catalyst stability/durability (compared to carbon supports).
- Improve electrode manufacturability and performance.

# Approach

## “Stabilize” Pt catalysts using “interactive” supports

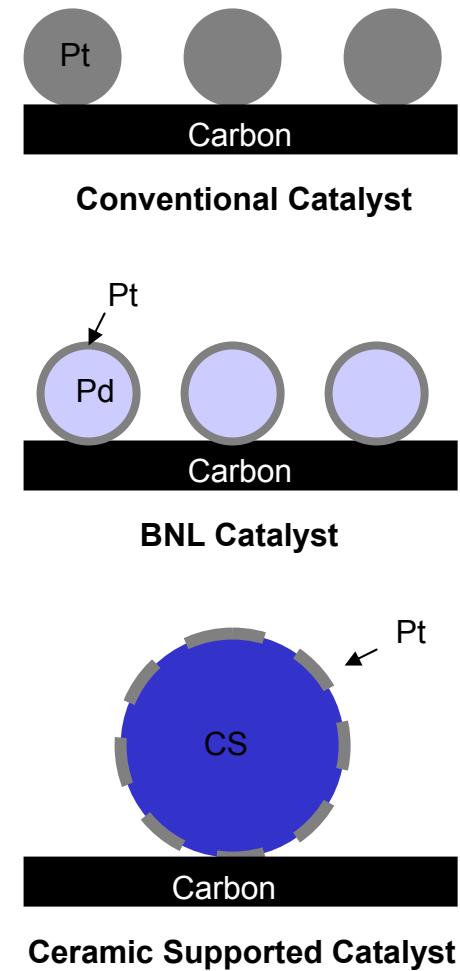

### 1) Use Group VIII type supports (BNL catalysts).

- Test low Pt-content catalysts for performance and durability

### 2) Use ceramic supports (CS) that “compensate” the Pt.

- Investigating CS's with unusual properties.
  - Understand CS properties and electrochemistry
  - Prepare materials suitable for FC testing
  - Capitalize on properties for electrode structures.

### 3) Develop theoretical models to understand support/catalyst interactions.

# Technical Targets & Project Milestones

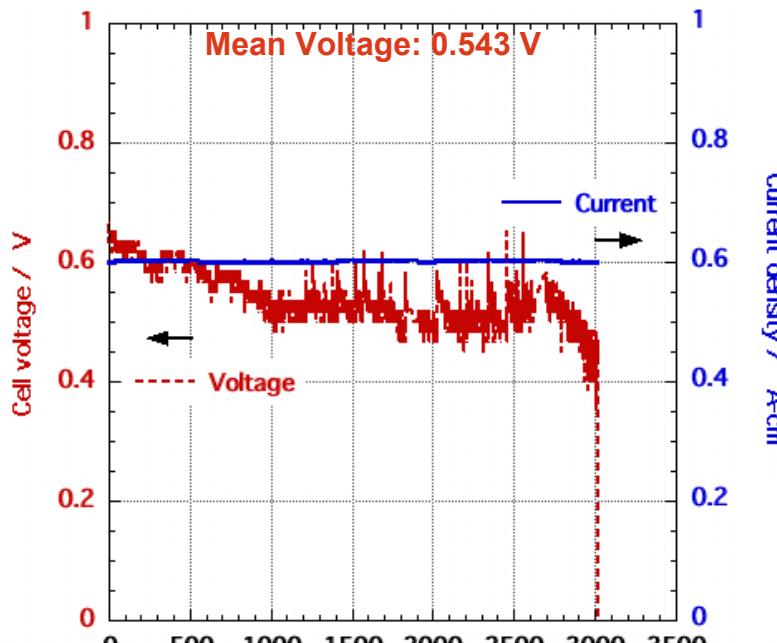

| Technical Targets (Tables 3.4.13 & 3.4.14) |                                       |             |       |                 |      |      |
|--|---------------------------------------|-------------|-------|-----------------|------|------|
| Characteristic                             | Units                                 | 2004 Status |       | Targets (Stack) |      |      |
|  |                                       | Cell        | Stack | 2005            | 2010 | 2015 |
| PGM* Total Content (Electrocatalyst TT)    | g/kW (rated)                          | 0.6         | 1.3   | 2.67            | 0.5  | 0.4  |
| PGM Total Loading (Electrocatalyst TT)     | mg PGM/cm <sup>2</sup> electrode area | 0.45        | 0.8   | 0.7             | 0.3  | 0.2  |
| Total Catalyst Loading (MEA TT)            | g/kW (rated)                          | 1.1         |       | 2.7             | 0.33 | 0.2  |

\*PGM - Platinum group metal

| Date    | Milestones for Electrocatalyst Supports and Electrode Structures   |
|---------|--|
| Dec 04  | Complete 1000 hr with 0.2 mg Pt/cm <sup>2</sup> at the anode and 0.08 mg Pt/cm <sup>2</sup> (BNL catalyst: 4% Pt-20% Pd) at the cathode                              |
| Feb 05  | Complete 1000 hr with 0.02 mg Pt/cm <sup>2</sup> (BNL catalyst: 2% Pt-20% Ru) at the anode and 80 µg Pt/cm <sup>2</sup> (BNL catalyst: 4% Pt-20% Pd) at the cathode. |
| Mar 05  | Predict by modeling and successfully synthesize the first versions of "doped" low-cost, stable and high surface area support materials.                              |
| Aug 05  | Identify the most promising support candidates by testing of electrochemical stability and intrinsic activity.   |
| Sept 05 | Test first variations of "new" electrode structures.   |

# Durability of low Pt-content cathode catalysts\*

(Dec '04 milestone)

BNL 20 LT full

H<sub>2</sub>/Air FC  
BNL20; N1135,  
Constant current test (80 °C)  
A: 0.18mgPt/cm<sup>2</sup> (20% Pt-C, ETEK)  
C: 0.077mgPt/cm<sup>2</sup> (20% Pd-4%Pt, BNL)  
(Total metal at the cathode: 0.45 mg/cm<sup>2</sup>)  
Stoich: H<sub>2</sub>/air= 1.3/2.0

Voltage losses after 2900 hr of testing  
at constant current (0.6 A/cm<sup>2</sup>):

| initial V | final V |
|-----------|---------|
| 0.65      | 0.51    |

- Result demonstrates considerable catalyst activity up to 3000 hr
- Long-term durability of the Pt-Pd cathode catalyst demonstrated

Catalyst surface area decrease

| Time<br>hr | Q <sub>H</sub><br>mC/cm <sup>2</sup> | S <sub>act</sub><br>m <sup>2</sup> Pt/g Pt |

# New Initiative: Modeling of Supports

- Atomistic-level modeling that accounts for the electron distributions at the interface should provide insight into support solutions.
- Quantum mechanicers from LANL Theoretical Division (Groups T-10 & T-12) have been engaged (leads: J. Kress & T. Redondo).
  - Methodology: Calcs will use the Vienna Ab Initio Simulation Package (VASP) based on the Generalized Gradient Approximation (GGA). The projector-augmented wave method is used to represent the inner core electrons and the valence electronic wavefunctions are expanded in plane waves.
- FY'05 Work Plan:
  - Model Pt monolayers on Pt, Pd and Ru.
  - Correlate surfaces with ORR activity.

## Recent Work w/ Pt Monolayers\*

| Surface    | Surface Energy           | $E_{ads}(CO)$ |
|------------|--------------------------|---------------|
| Pd(110)    | 1510 erg/cm <sup>2</sup> | 1.55 eV       |
| Pt/Pd(110) | 1760 erg/cm <sup>2</sup> | 1.58 eV poor  |
| Ru(001)    | 2530 erg/cm <sup>2</sup> | 1.78 eV       |
| Pt/Ru(001) | 1640 erg/cm <sup>2</sup> | 1.22 eV good  |

## Second Approach: Ceramic Support (CS) Materials (balance of milestones)

- Objective is to “replace” PGM support (BNL catalysts) with alternatives.
- Alternative supports must be:
  - Low-Cost,
  - Electrochemically Stable,
  - Electronically Conductive,
  - A suitable host for Pt monolayers and nanoparticles.
    - i.e., enable bulk-like activity (unlike carbon).
      - more than just Van-der-Waals interactions.
      - less than total assimilation (unless Group VIII support).
  - Limited Possibilities:
    - Focusing on refractory conductive ceramics.
      - few are electrochemically stable.
      - fewer yet promise to be suitable hosts.

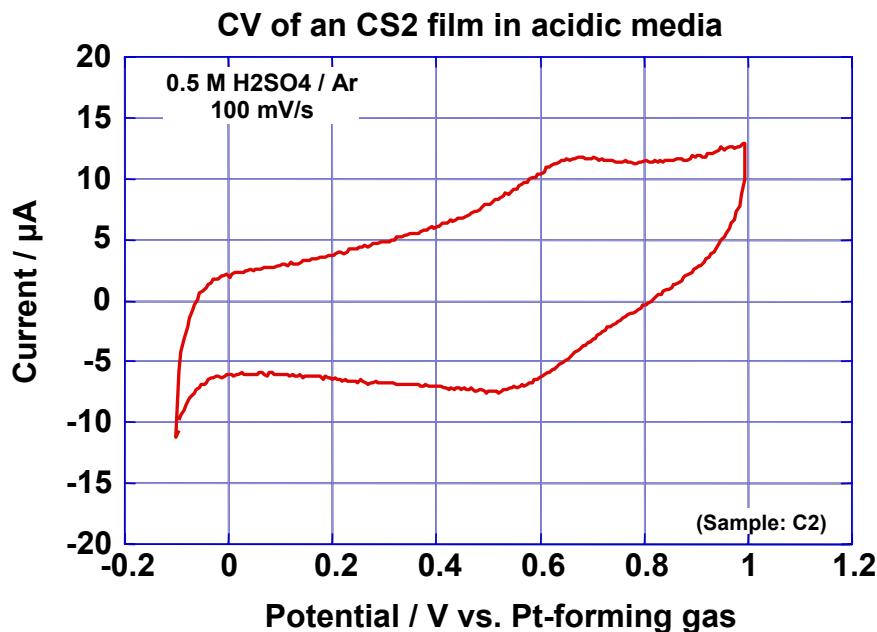

## A New Class of Ceramic Support (CS) Materials

- Certain CS materials support spontaneous deposition.
  - So far have identified three (CS's 1-3) that support deposition.
  - Spontaneously deposits Pt, Pd, Au, Rh, .....
  - Catalyzation process:
    - Add solution.
    - Deposits in seconds.
    - Dry, rinse, or use as is.
- Other Pros:
  - Electrochemically stable
  - "High" dispersions even with low surface area supports.
- Cons:
  - Material availability and sizes

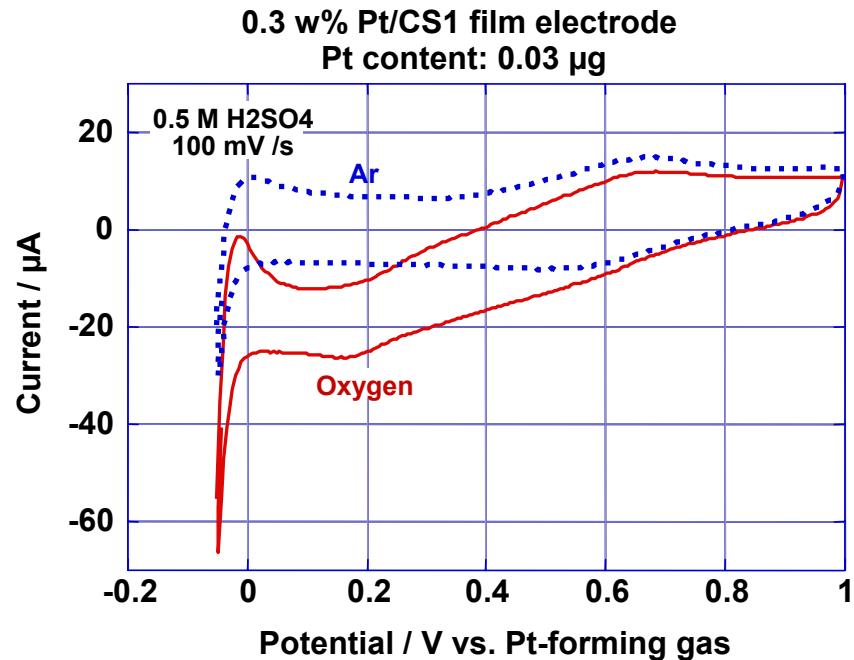

## Sample CVs of CS's

### Uncatalyzed CS2

--- Unusual CV for a Ceramic

### Pt catalyzed CS1

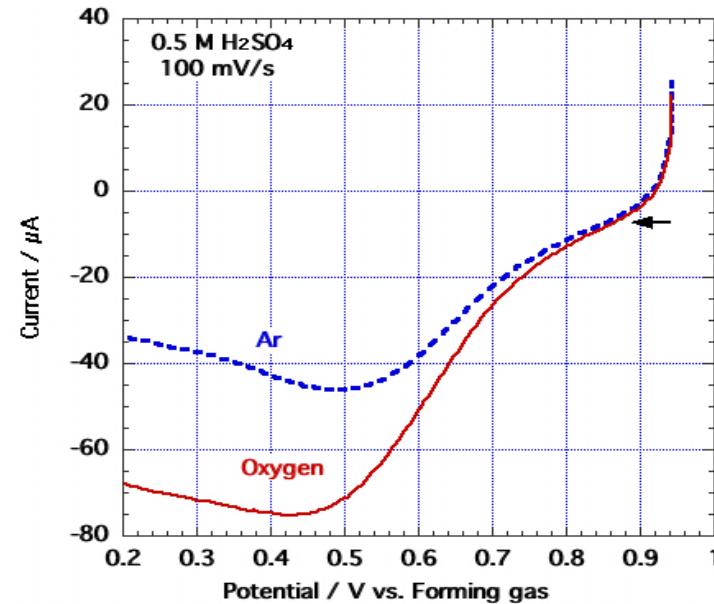

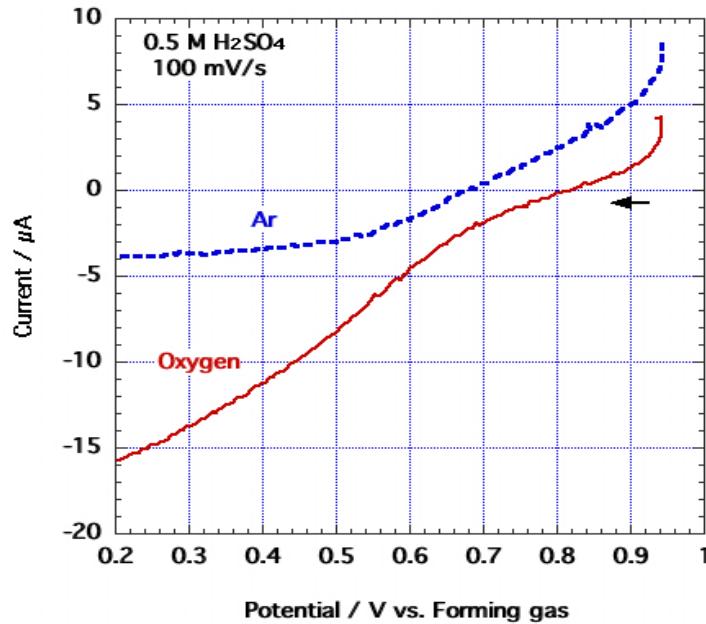

--- Off-set due to ORR superposition on baseline (Ar) scan.

# Linear Sweep Voltammetry of CS films containing spontaneously deposited Pt

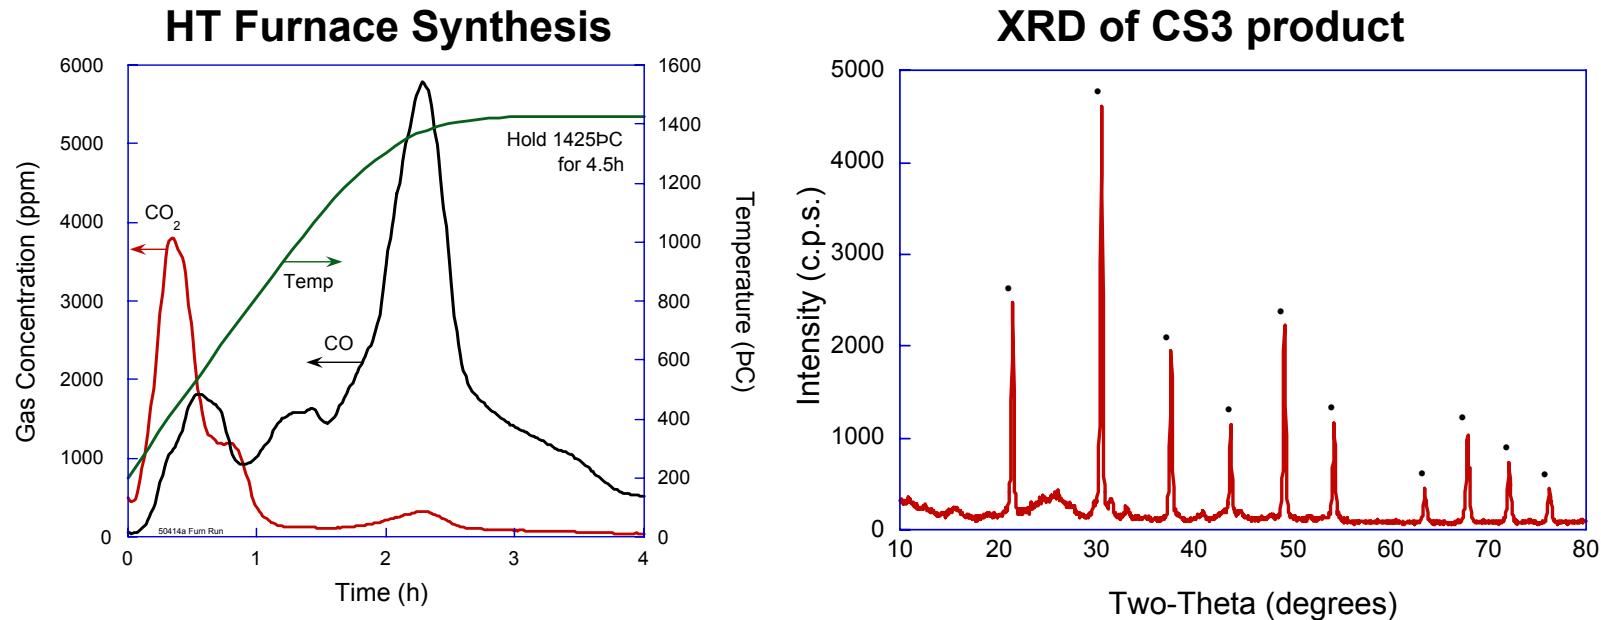

Comparison of CS1 & CS2 results

Maximum Pt content in each case: 0.4  $\mu\text{g}$ .  
Pt diameter:  $\sim 5 \text{ nm}$  (from XRD)

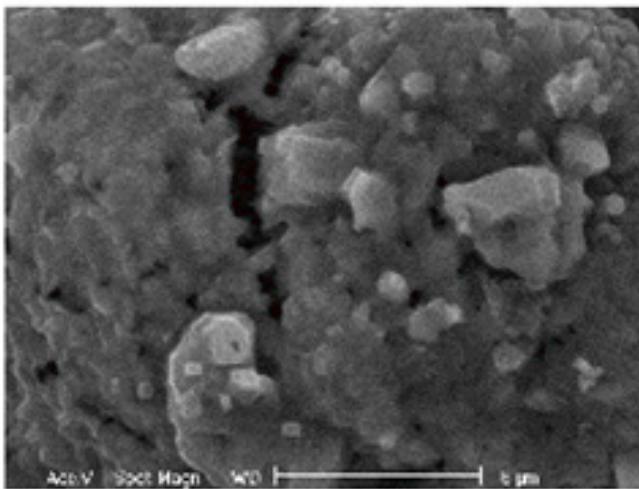

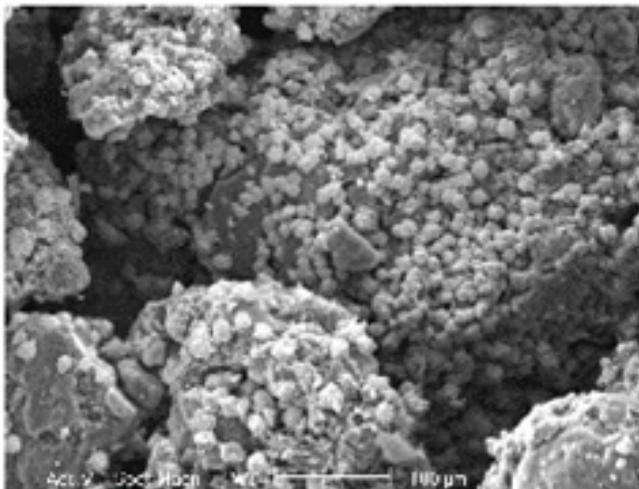

- Qualitative results, rotating-ring disk electrode (RRDE) experiments will be used to quantify ORR performance.
- Higher surface area CS's are needed to attain higher Pt dispersions and useful FC supports.
- Commercial CS3 powders are too impure for testing.

# Synthesis of High Purity, High-Surface Area CS3 low-cost materials and process

- **~ 50 wt% CS3 on carbon.**
- **< 1000 Å average diameter CS3 crystallites (vol. weighted).**
- **Precursor is critical - otherwise no or minimal yield of desired material.**
- **Source materials < \$1/g.**
- **First “success” - much yet to do wrt particle size.**

## Characterization of Synthesized CS3

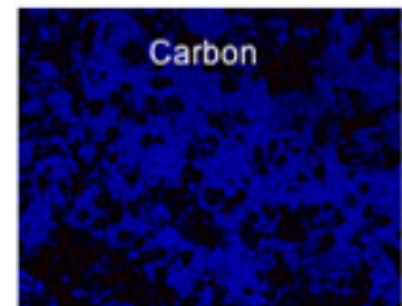

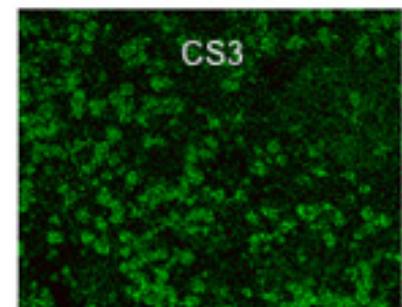

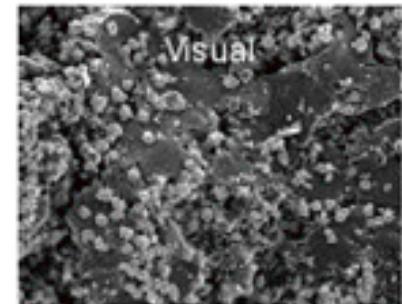

### SEMs

- Sample appears to consist of ~ 10 micron crystalline agglomerates on a >> 100 micron substrate

### Elemental Mapping →

- Indicates that the agglomerates are CS3 rich and the substrate is a carbon rich mixture containing CS3.
- “majority” of CS3 in the substrate?

## Responses to '04 Reviewers' Comments

- “Results are measurements on BNL catalysts - approaches to making improvements are scarce” (edited).
  - LANL “support” effort modest and just started up in ‘04.
  - Majority of “reportable” results were on BNL catalysts. Did not reflect total LANL effort.
- “Inadequate staffing/resources to pursue new materials development. Progress and ability to relate properties to scale-up will be lacking” (ed.).
  - New personnel on board that excel in materials development.
  - Good track record in developing technologies adopted by industry.
- “Efforts on low-cost catalyst support materials may not be most effective use of time by this group.” “Less focus on new materials development.”
  - New materials development very important for success of FCs.
  - Low-cost supports are actually an interesting scientific challenge - drives to the heart of what constitutes an active surface.

### Why investigate new Supports?

- Possibly provides another tool (like alloying) to improve Pt performance
  - Manipulating metal-support interactions may improve:
    - *Dispersion & Utilization*
    - *Activity of highly dispersed particles*
    - *Durability*

# Accomplishments and Milestone Progress

- Demonstrated long-term performances of low Pt-content (BNL) catalysts.
- Discovered ceramics that support spontaneous deposition (in addition to providing low-cost, conductivity, electrochemical stability, etc.).

| Date   | Milestone  | Status                        |
|--------|--|-------------------------------|
| Dec 04 | Complete 1000 hr with 0.2 mg Pt/cm <sup>2</sup> at the anode and 0.08 mg Pt/cm <sup>2</sup> (BNL catalyst: 4% Pt-20% Pd) at the cathode                              | Completed<br>3000 hr          |
| Feb 05 | Complete 1000 hr with 0.02 mg Pt/cm <sup>2</sup> (BNL catalyst: 2% Pt-20% Ru) at the anode and 80 µg Pt/cm <sup>2</sup> (BNL catalyst: 4% Pt-20% Pd) at the cathode. | In progress (500 hr)          |
| Mar 05 | Predict by modeling and successfully synthesize the first versions of “doped” low-cost, stable and high surface area support materials.                              | “Half”Done<br>(new direction) |
| Aug 05 | Identify the most promising support candidates by testing of electrochemical stability and intrinsic activity.   | Mostly Complete               |
| Sep 05 | Test first variations of “new” electrode structures.   | Developing                    |

# Future Work

## ■ Remainder of FY'05.

- Continue FC testing of BNL catalysts.
  - Study particle size changes after long term operation.
- Develop quantum mechanical models.
- Screen other CS's for "activity."
- Understand spontaneous deposition process.
- Synthesize high-purity, high-surface area CS's.
- Attain and test high Pt dispersions on CS's.
  - Quantify ORR performance using RRDE's.
- Attempt first new electrode structures / processes.

## ■ FY'06.

- Continue optimizing CS materials and CS based catalysts.
- Fuel cell testing of BNL and CS-based catalysts.
- Develop advantageous CS-based electrode structures.
- Expand theoretical models to CS's, etc.
- Study catalyst surface characteristics and changes using X-ray absorption techniques (S. Conradson).

# Hydrogen Safety

The most significant hydrogen hazard associated with this project is:

*Hydrogen leak in the hydrogen supply leading to accumulation in the room with ignition leading to an explosive event.*

# Hydrogen Safety

Our approach to deal with this hazard is:

*In labs with hydrogen supply from cylinder banks or from a hydrogen generator, hydrogen sensors have been installed and are interlocked with the hydrogen gas supply.*

*Two sensors are installed in every room for redundancy.*

*Sensors installed at ceiling level where accumulation is most severe.*

*H<sub>2</sub> sets off the alarm at 10% of Lower Flammability Limit (LFL).*

*In rooms that use only bottled hydrogen, only a single cylinder is in the room at any given time and bottle sizes are limited to ensure being safely below the LFL of the room even with complete release of a full cylinder.*

*Work has been reviewed and approved through Los Alamos National Lab's safety programs:*

*Hazard Control Plan (HCP) - Hazard based safety review*

*Integrated Work Document (IWD) - Task based safety review*

*Integrated Safety Management (ISM)*
