

# ***Complex Hydrides for Hydrogen Storage***

**George Thomas, Consultant  
Sandia National Laboratories**

# ***Efficient onboard hydrogen storage is a critical enabling technology for the use of hydrogen in vehicles***

- The low volumetric density of gaseous fuels requires a storage method which densifies the fuel.
  - This is particularly true for hydrogen because of its lower energy density relative to hydrocarbon fuels.
- Storage methods result in additional weight and volume above that of the fuel.

***How do we achieve adequate stored energy in an efficient, safe and cost-effective system?***

## ***One storage option is to chemically bond hydrogen in a solid material***

- This storage approach should have the highest hydrogen packing density.

However, the storage media must meet certain requirements:

- reversible hydrogen uptake/release
- lightweight
- low cost
- cyclic stability
- rapid kinetic properties
- equilibrium properties (P,T) consistent with near ambient conditions.

# Where do we start?

**Transition metals (IIIB, IVB, VB) form metallic bond hydrides**

- moderate *P, T* properties
- equilibrium properties can be adjusted over a wide range by alloying.
- Interstitial H: good kinetics
- low capacity (heavy metals, modest H/M)

## *Complex hydrides give you another “knob to twist”*

- Complex hydrides consist of a **H=M** complex with additional bonding element(s)
- hydrogen complexes include:
  - **(AlH<sub>4</sub>)<sup>-</sup>** (alanates)
  - **(BH<sub>4</sub>)<sup>-</sup>**
  - with Group VIII elements
- features:
  - ionic, covalent, metallic bonding
  - can have lower formation energy
  - can have high H/M
- 173 complex hydrides listed on *hydpark.ca.sandia.gov*

# Total hydrogen content of some alanates

# *Issues with complex hydrides*

- Reversibility
  - role of catalyst or dopant
- Thermodynamics
  - pressure, temperature
- Kinetics
  - long-range transport of heavy species
- Cyclic stability
- Synthesis
- Compatibility/safety

*only NaAlH<sub>4</sub> has been studied in detail to date  
this material serves as a model system to better  
understand other complex hydrides*

## ***Brief history of NaAlH<sub>4</sub>***

- Compound first reported by Finholt & Schlesinger in 1955
- Direct synthesis developed by Ashby (1958) and Clasen (1961)
- Principal use has been as a chemical reducing agent
- There have been numerous characterization studies: (Dymova, Zakharkin, Claudy, Wiberg...)
- Reversibility demonstrated by use of Ti catalyst (Bogdanovic and Schwickardi MH96, JAC 253(1997) 1)

***this development spurred renewed interest in using complex hydrides as storage materials***

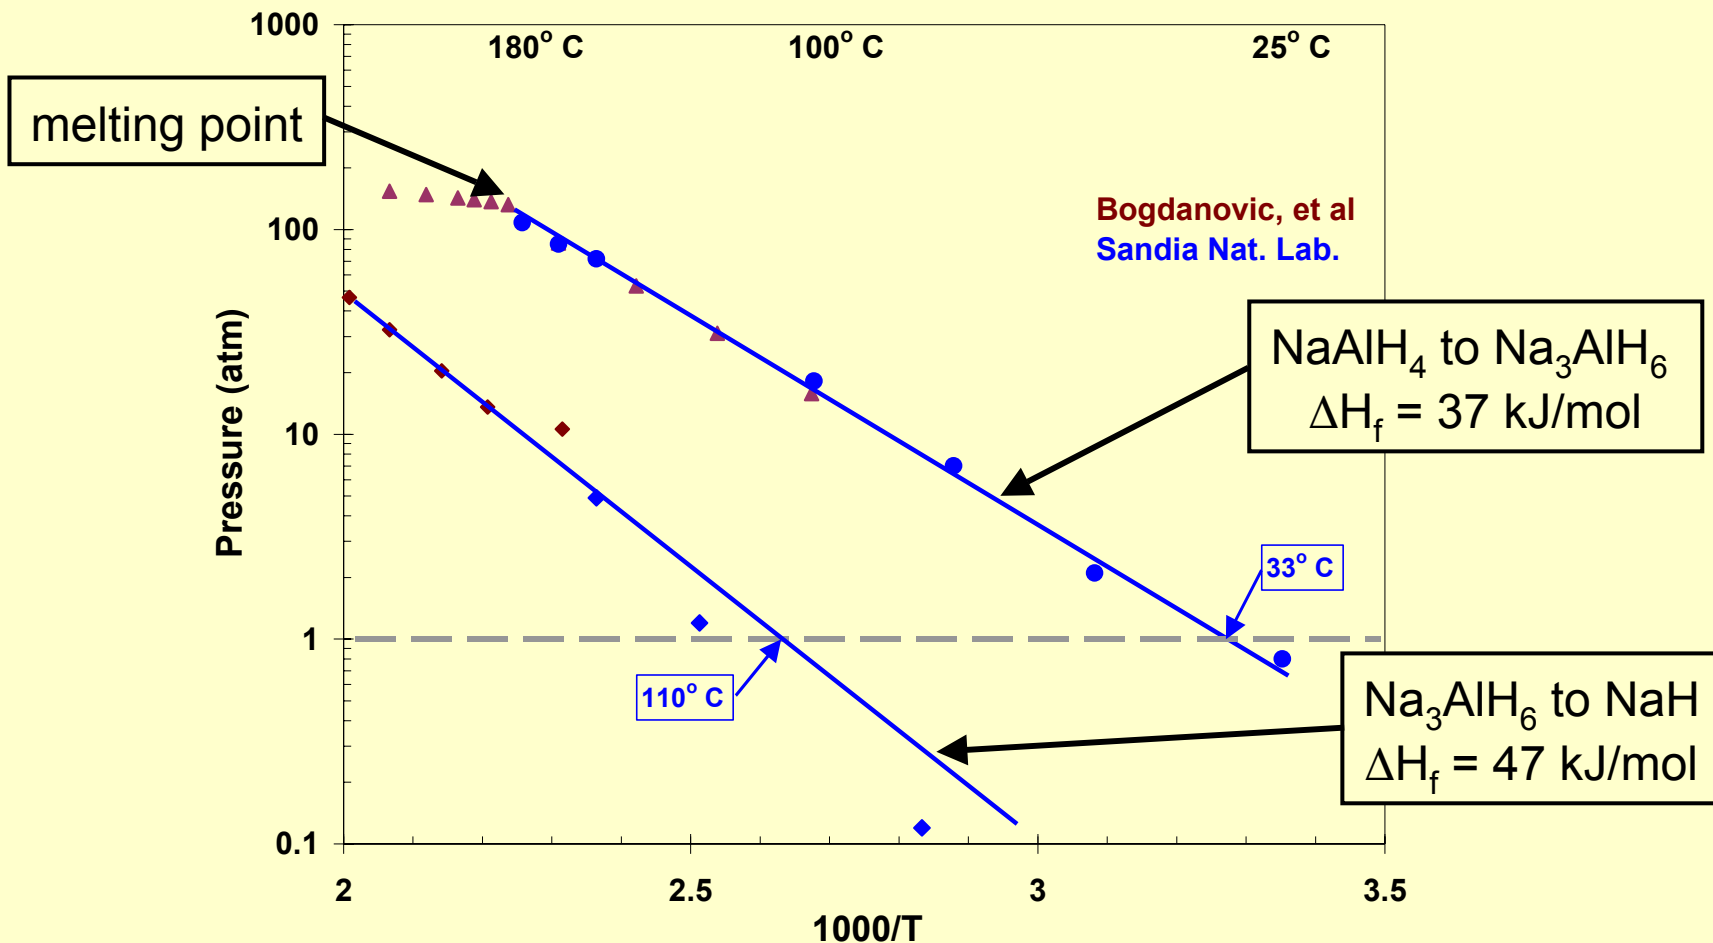

## *Na Alanate - a reversible complex hydride*

- There are five labs within USDOE program during FY02 working on complex-based hydrides, focused mainly on  $\text{NaAlH}_4$ 
  - Univ. of Hawaii Prof. C. Jensen
  - Sandia Nat. Lab. Dr. K. Gross
  - Florida Solar Energy Center Dr. D. Slattery
  - United Tech. Res. Center Dr. D. Anton
  - Savannah River Tech. Center Dr. R. Zidan
- These labs have formed a working group to coordinate their activities and share information.

# *Na Alanate - a reversible complex hydride*

- There are development projects outside of the US.
  - B. Bogdanovic, Max Planck Inst., Mulheim, Germany
    - GM Opel support
  - A. Zaluska, L. Zaluski
    - recently left McGill Univ. (Canada)
    - HERA (HydroQuebec, GfE, ShellHydrogen)
  - Japan funding development through WENET, AIST
- Ames Laboratory has recently published some work on Li alanate

# Thermodynamic data

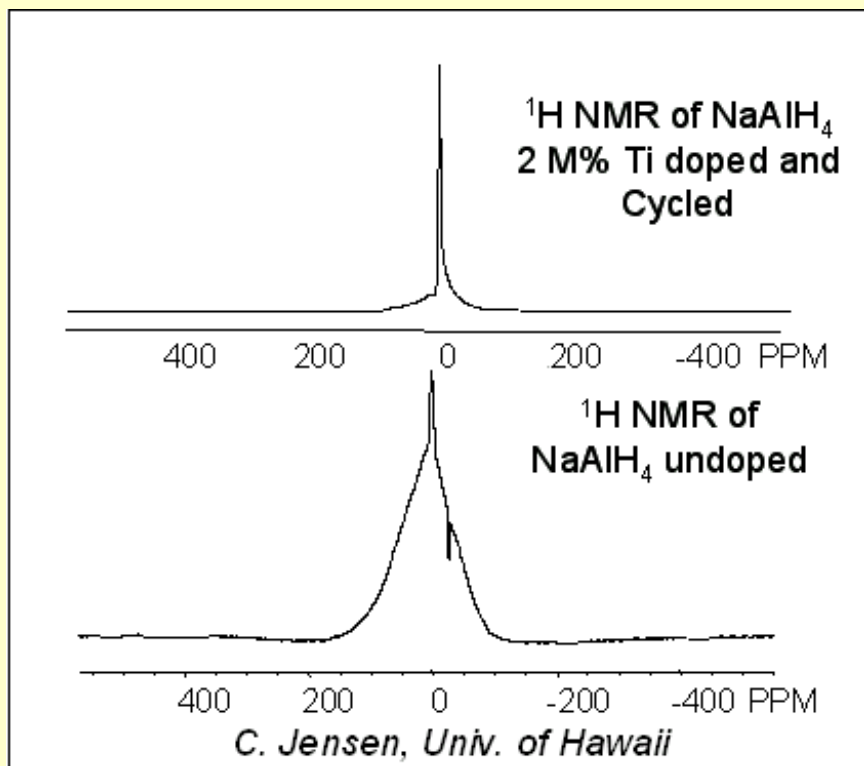

## *Current studies on NaAlH<sub>4</sub>*

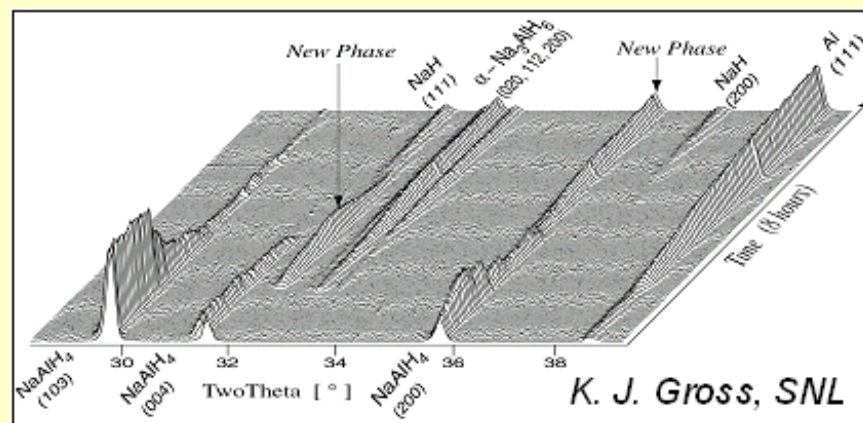

- Mechanisms
  - experimental
  - modelling
- catalysts, doping
- mechanical processing
- synthesis
- engineering properties

# Understanding $\text{NaAlH}_4$ mechanisms will help in developing higher capacity hydrides

**NMR shows Ti doping enhances proton mobility**

**ESR spectra characteristic of  $\text{Ti}^{3+}$**

**Decomposition of undoped  $\text{NaAlH}_4$**

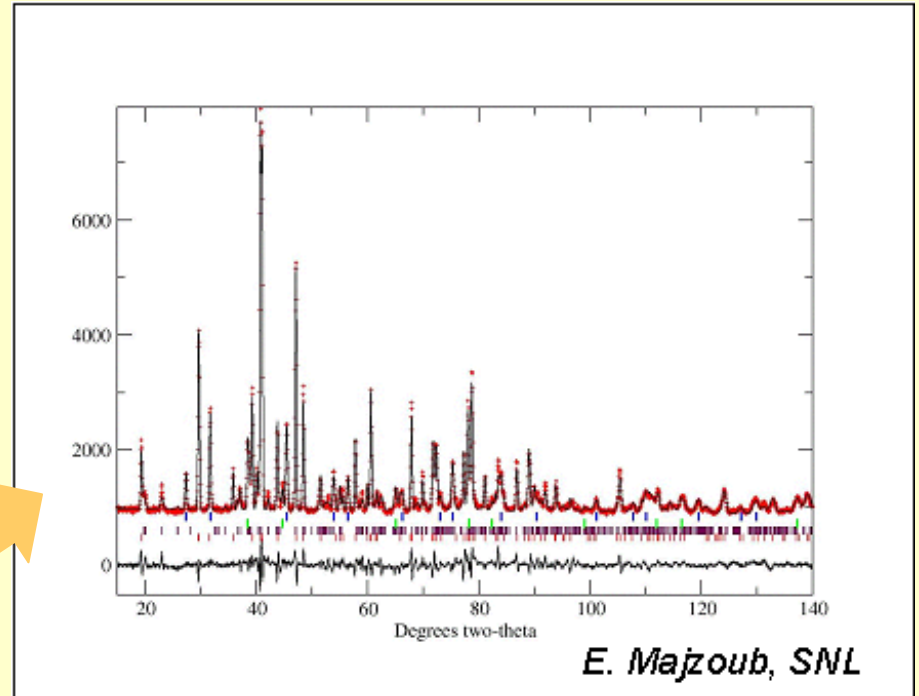

# Crystal structure and modeling

**Neutron diffraction  
Rietveld refinement**

G. J. Thomas

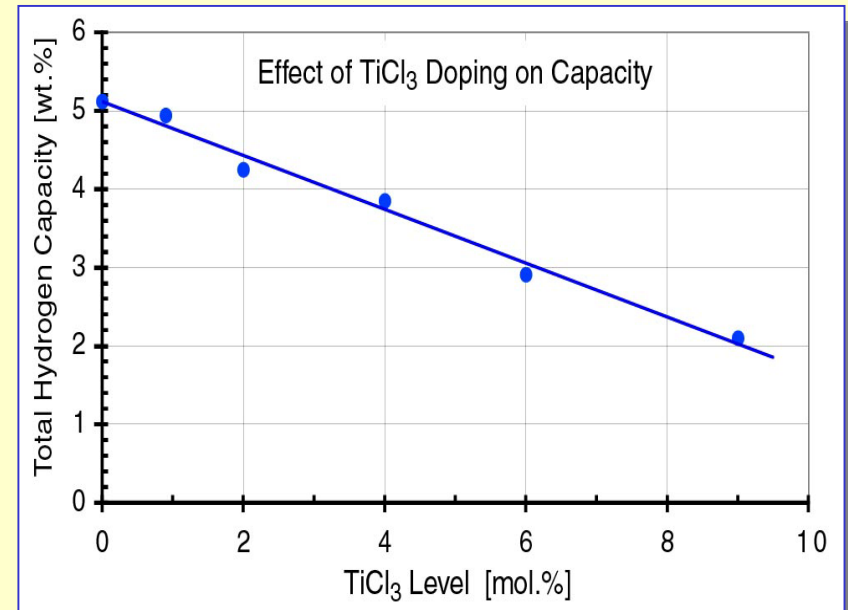

***Ab initio* calculations  
using VASP**

# *Catalysts/Doping*

- Initially, reversibility believed due to catalytic effects.  
recent evidence, however, indicates bulk doping.
- 3 factors affect hydride performance:
  - (1) catalyst/dopant
    - numerous compounds evaluated.
    - Ti-based most effective.
  - (2) method of introduction
    - mechanical mixing (dry process)
    - wet chemistry
    - precursor must react with alanate
  - (3) amount of catalyst/dopant

# Catalyst/Doping level affects kinetics and capacity

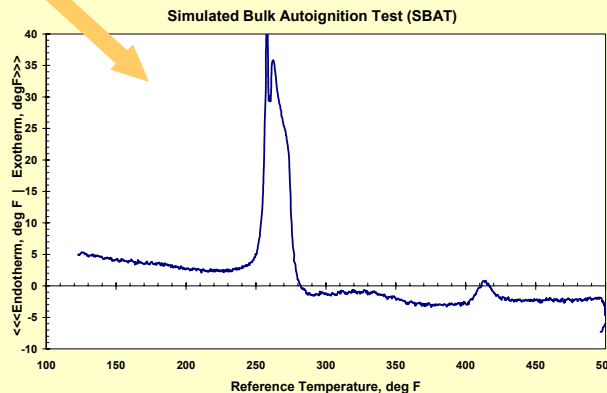

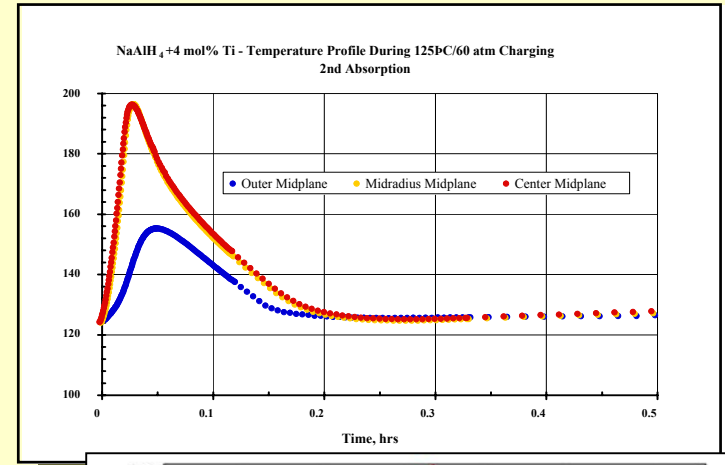

(G. Sandrock, K. J. Gross, G. Thomas, JAC 339 (2002) 299)

- **Initial kinetics exhibit Arrhenius behavior**
- **different activation energy in doped material**
- **activation energy constant for 2 mol% and greater doping**
- **faster kinetics with higher doping levels**

- **Trade-off between faster kinetics and loss of capacity with increasing doping levels**

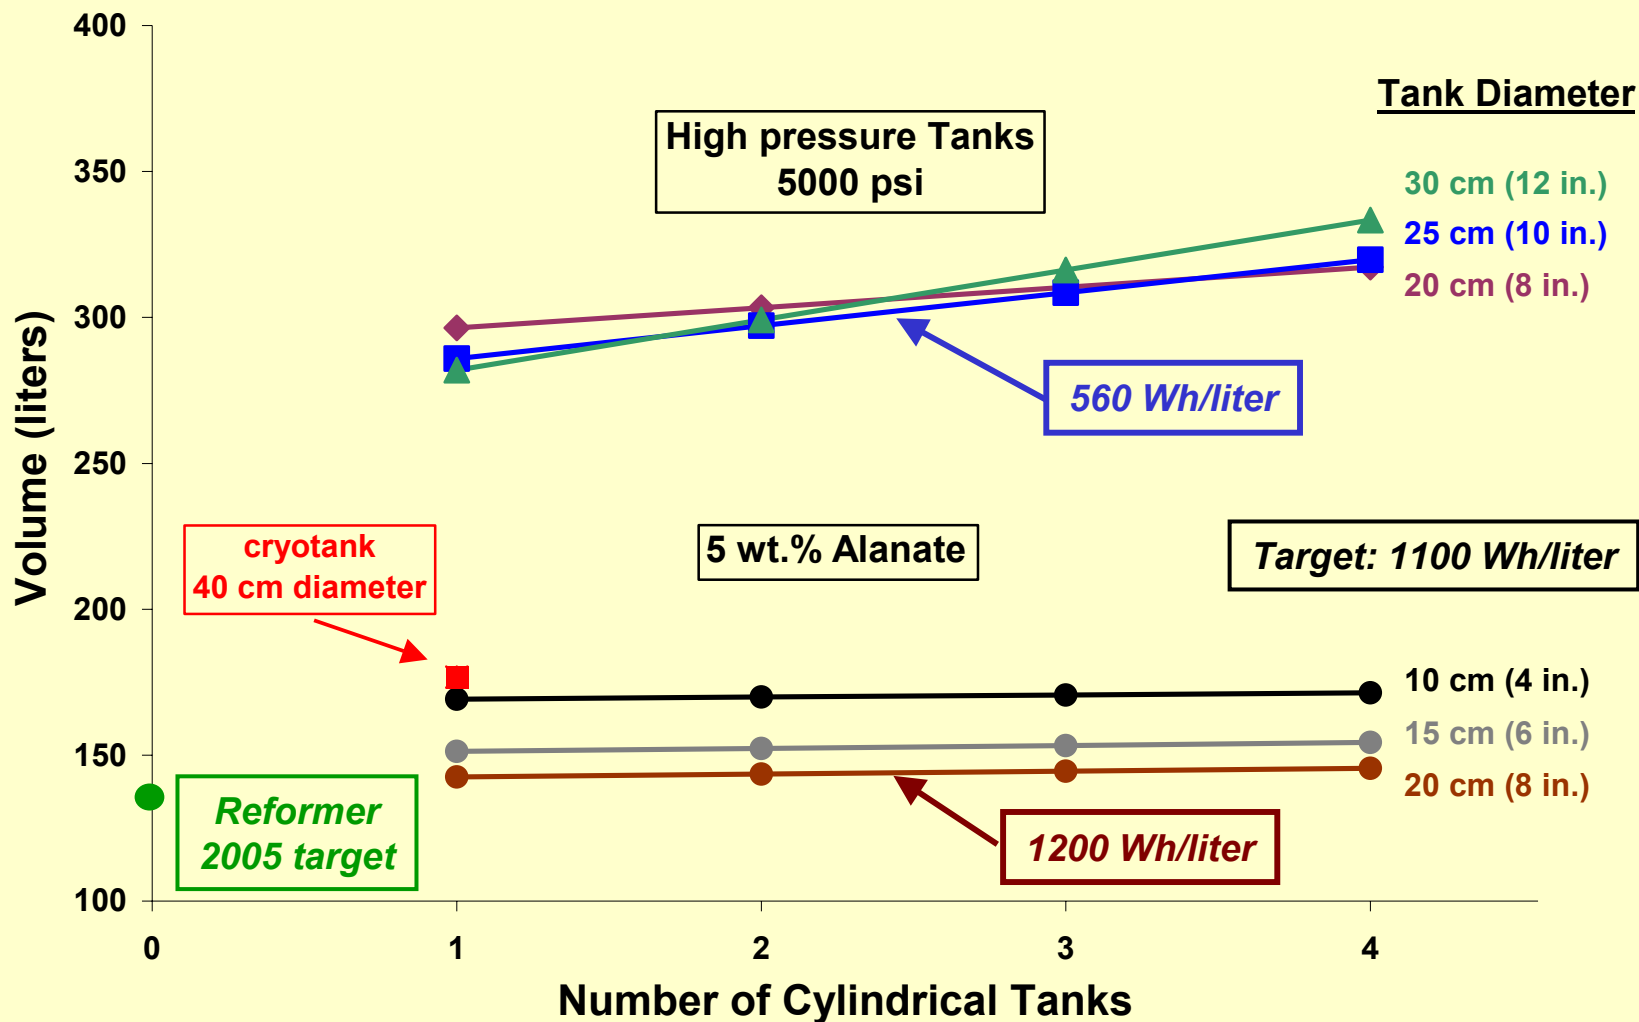

# Engineering Properties

- Thermal conductivity
  - similar to IM hydrides cycling
  - stable to ~100 cycles
- material compatibility
  - no issues with Al, SS
- safety
  - sensitive to impact, thermal environment with air exposure.

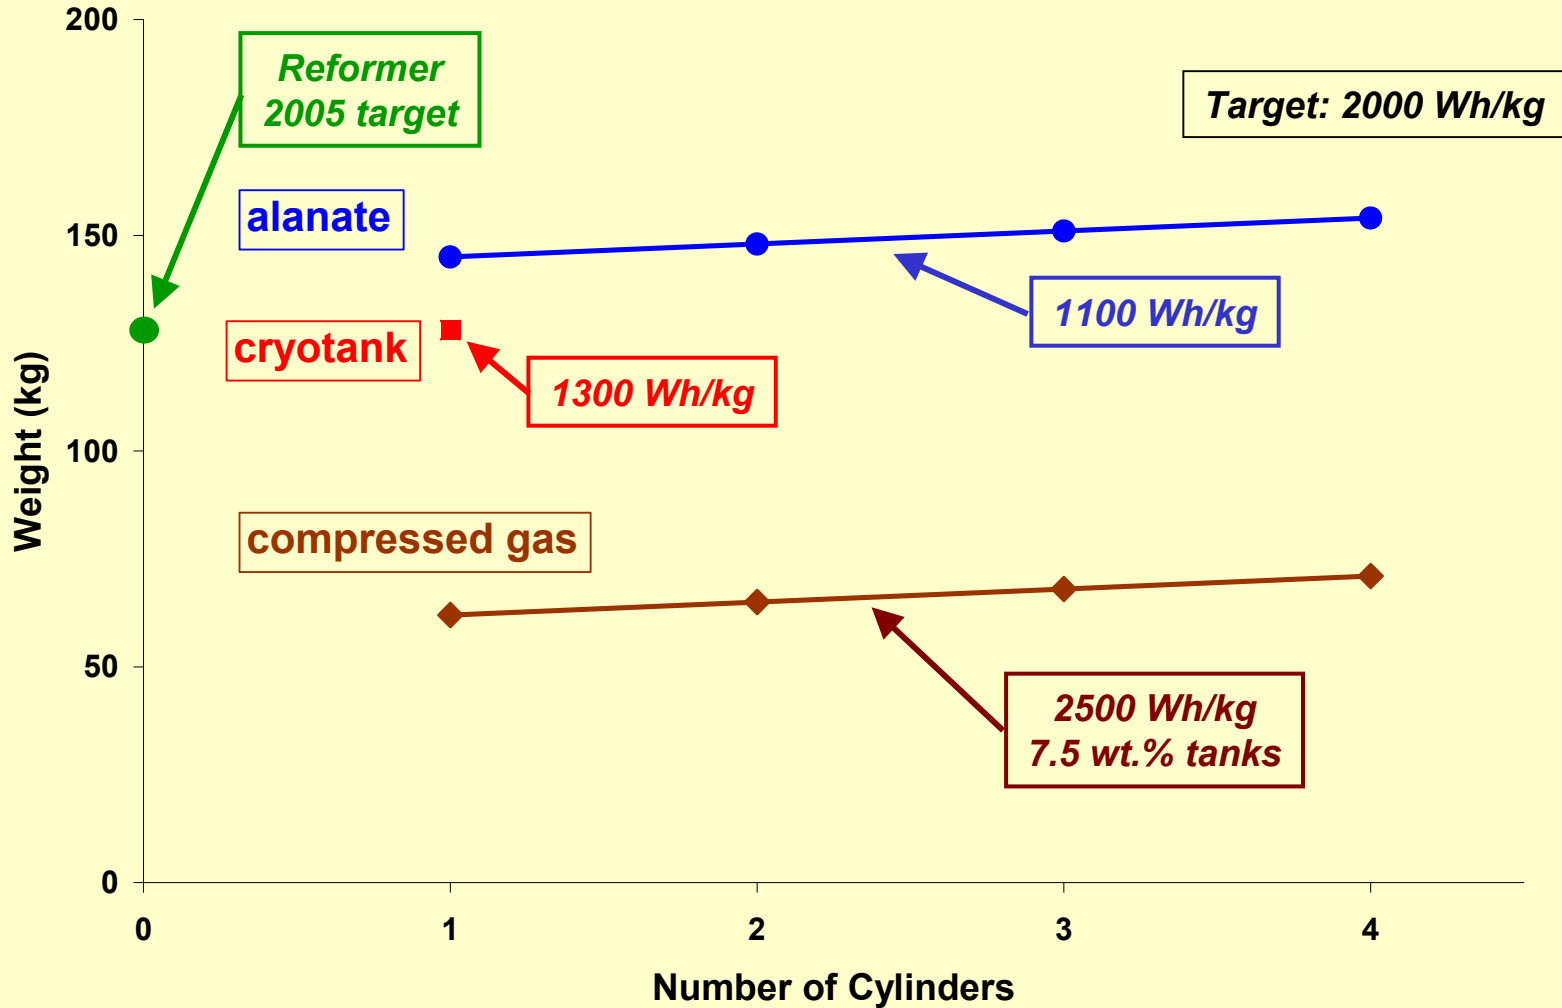

# 5 kg H<sub>2</sub> system volumes

## Volumes of 5 kg H<sub>2</sub> Systems

# 5 kg H<sub>2</sub> system weights

## System weights for 5 kg H<sub>2</sub>

# *A complex hydride based on $BH_4^-$ forms the basis for a chemical hydride storage system*

- Development efforts largely financed privately.
  - Millenium Cell  
an IP company with no plans to manufacture.
  - Kogakuin Univ., Japan (Prof. S. Suda)
- Both based on borohydride chemistry.
  - each use different catalyst.
- System has 4-10 wt.% capacity
- reversibility a problem with boron-based systems

20 - 35% sol.  
Stabilized with  
1-3% NaOH

Proprietary  
catalyst

Borax in NaOH

## ***Where do we go from here?***

- What's beyond  $\text{NaAlH}_4$ ?
  - Capacity appears limited to ~5 wt. %
  - modifications or new complexes needed.
- Some improvements in weight, volume and cost can be realized by better container engineering.

*Intermetallic hydrides were studied for thirty years before doped alanates provided a significant improvement in capacity.*

***We need to be a little faster!***
